Alvar Aalto in Kouvola

The River Kymijoki and the wood-processing industry associated with it have played an important role in the creation of cultural environments and architectural sites in Kouvola. Roads and railways have been built to Kouvola to support the operation of industrial production plants in the region. The industrial communities that emerged include not only actual industrial facilities but also homogeneous residential areas and functions such as churches, schools and medical services that serve the workers and other residents.

The wood-processing industry in Anjala and Inkeroinen originated from Ankkapurha, in other words the large rapids. The Inkeroinen groundwood plant (originally Ingerois trädsliperi bolag) was built on the Lohisaari island of the river in 1872. The plant was the first facility in Kymenlaakso to produce groundwood.

The wooden mill that produced tissue paper and newsprint burnt down in 1881, and the rebuilt board mill started in 1887. A new board mill was completed next to the old one in 1965. The old board mill now houses the Ankkapurha Industrial Museum, which features, among other things, the first continuous board machine in Finland, purchased for Inkeroinen in 1897. There are two hydroelectric power plants in the Ankkapurha rapids. The biggest hydroelectric power plant of its time was completed on the Inkeroinen side of the river in 1919–1922.

Towards the end of the 1930s, Tampella Oy established the Anjala Paper Mill in Inkeroinen, located north of the earlier mills. Alvar Aalto, the architect who had designed the Sunila mill area, was commissioned to do the design work. The design work began with the construction plan for the Inkeroinen mill site. That plan served as the basis of the plans for the mill, warehouse and production buildings of the paper mill itself and also for the conversion plans for the residential and office buildings in the Tehtaanmäki area. One of the items that has survived to the present day of the general plan is the Karhunkangas residential area, which was designed in 1938 for a total of 70 detached houses. Nine different Puutalo Oy's house types, a public sauna and laundry building, a co-operative shop and a pump station designed by Alvar Aalto were built in the area. These were built by the building department of the mill in 1938–1941. They were assigned to the workers of the mill against the cost of materials.

Alvar Aalto architects' office not only designed several industrial buildings for Inkeroinen but also items such as the Tehtaanmäki school, a teachers' residence, new residential buildings for mill workers, foremen and engineers, and medical buildings in Inkeroinen and Sippola. Not all of the buildings designed by the office for Inkeroinen were actually built, and many were later demolished or converted beyond recognition. The Anjala Paper Mill was refurbished and its production facilities were expanded in the 1980s.

The Tampella mill was acquired by Stora Enso in 1993. Stora Enso's Anjalankoski mills now consist of the Inkeroinen Board Mill and Anjala Paper Mill. The mills and the industrial community around them constitute a valuable built cultural environment where the architecture of Alvar Aalto, the most prominent Finnish architect of all times, is intensely present.
